Summary

I am a researcher with expertise in multiple disciplines, including mathematics, computational science, oceanography, and finance. I have an excellent publication record and presented my work at local and international conferences. My work required running and diagnosing ocean and climate models, developing biogeochemistry models, parameter optimisation, and analysing large datasets. But a key part of my profile is my keenness for finding elegant solutions to complicated problems and my passion for developing and contributing to open-source scientific software. I am also passionate about education, despite limited opportunities for teaching.

During the past few years, I have been investigating the response of the ocean's carbon and oxygen cycles to global warming, with a particular interest for the role played by changes in ocean circulation. Today, I would like to put my skills at the service of the fight against climate change by contributing to the development of science-based innovative solutions and strategies.
